Graphics In addition to the ability to edit existing drawings, C++, AutoLISP and .NET classes can provide the functionality to create new drawings, structures, and to populate the drawing with data. A function can be defined as an event-based function (such as a button click), or as a function that runs as an automated action, such as a tool command. Many object types (such as components, layers, and drawing elements) are also available to the user. Using the C++ class library, AutoCAD objects can be combined together. For example, a drawing object can be created that contains a selection of many lines, and a structure object can be created that contains many line segments. C++ programming allows the automation of drawing and design projects, especially with the use of plugins for AutoCAD.
